Photoshop has always been a tool for building complex tasks into a single process. If you look at the features that include layers, channels, and selections, you can see how powerful Photoshop is. To see everything the application does, you need only to get in and play. Not only are there many features to explore, but there are hundreds of tutorials on the Internet to help you learn how to use them. It is the reason why many people become addicted to the product. It is significant that the world's largest graphic design software company has taken advantage of these new technological advances. The tags are there for easy access by all. When you are editing, your browser history with the tags is saved locally, and you can use that to get back to pages and searches that you've completed earlier. It's not a lot of help if you end up going to a far side of the Internet without saving your browser's history, though. Another new feature only available in the Photoshop and Photoshop Elements apps is batch operations. For example, I create a new document, insert a new layer, apply a filter, and then use the keyboard shortcuts to move the layer to an exact location. Bam. Done. No need to select the item in the dialog box the trackball focuses on. Instead, I can just use the keys and I'm in business.
