The purpose of Photoshop is to take the original image and transform it into the image you want it to be. It's a way of combining your picture elements (or pixels) to make a new image that goes beyond the original. You do this by adjusting colors—reducing or increasing them using a range of tones,

including important ones like highlights, shadows, and midtones. You also adjust the brightness, contrast, and intensity of different colors. Using the Camera app and Photoshop app for iOS and Android devices, you can use your fingers to adjust the colors of your photo. You can change individual pixels, color swatches, and other selections. You also can use Palm Controls to quickly adjust the brightness, contrast, or saturation of selected portions of the image. Some people have placed the connection between color and mood to a higher level. If you want an image to be bright and lively, you use a strong palette of bright colors. If you want a moody, moody image, you use muted colors. It's up to you to decide. But remember, if you were going to have a moody image, you should have also chosen red eyed grass. It might not be very bright, but it's powerful. This public preview of Photoshop Camera is made possible through Microsoft's Visual Studio community and the LIT repository .
